48	U.SBased National/International X.25 Service Revenue Share by Region, 1996 and 2001	76
49	U.S. SMDS Service Revenue, 1996–2001	77
50	U.S. SMDS Port Installed Base Share by Access Speed, 1996 and 2001	79
51	U.S. SMDS Service Revenue Share by Customer Type, 1996 and 2001	80
52	U.S. SMDS Service Revenue Share by Provider Segment, 1996 and 2001	82
53	U.S. SMDS Customer Share by Provider Segment, 1996 and 2001	83
54	U.S. SMDS Port Installed Base Share by Provider Segment, 1996 and 2001	84
55	U.S. Local SMDS Service Revenue Share by Provider, Midyear 1997 and Yearend 1996	. 85
56	U.S. Local SMDS Port Installed Base Share by Provider, Midyear 1997 and Yearend 1996	
57	U.S. Local SMDS Services Revenue, 1996–2001	. 87
58	U.SBased National/International SMDS Service Revenue, 1996–2001	. 89
59	U.SBased National/International SMDS Service Revenue Share by Region, 1996 and 2001	. 92

Abstract

U.S. Packet/Cell-Based Services Market Share and Forecast, 1996–2001

This report analyzes the market for the following packet/cell-based services: frame relay, asynchronous transfer mode (ATM), X.25, and switched multimegabit data service (SMDS). It quantifies and forecasts the local and national/international revenue of U.S.-based telecommunications service providers. It includes yearend 1996 and midyear 1997 market share by revenue and ports for each service segment and 1996–2001 revenue and port forecasts for each service segment. Specific assumptions related to the development of each market segment are included for the local and national markets.

Executive Summary

The total U.S. market for packet/cell-based services (frame relay, ATM, X.25, and SMDS) will reach nearly \$3.3 billion by yearend 1997, representing a growth rate of 64% from 1996's total of approximately \$2.0 billion. IDC forecasts that the total packet/cell-based services market will grow to more than \$10.5 billion in 2001.

Overall, the market is being driven by the increasing connectivity requirements of businesses, government and educational institutions, and network service providers. More specifically, developments such as new customer growth, expansion of existing customers' networks, the impact of new types of customers such as ISPs, and customer migration between different data services — in particular, away from private lines — are fueling the growth of the packet/cell-based services market.

Frame relay is the single largest service segment of the overall packet/cell-based services market and will remain so during the forecast period as the service matures and is perceived as more of a mass-market business offering. ATM will also become a more important segment of the overall data services market. The relative position of X.25 is due to customer migration to other technologies and continued pricing pressure on X.25 services. IDC expects SMDS to remain a niche service.

Sprint leads the overall shared data services market, followed by AT&T and MCI. From yearend 1996 to midyear 1997, Sprint lost market share, primarily to MCI and AT&T, but Sprint remains in first place overall because of its dominance of the X.25 market and its strong showing in the ATM market. Among local providers, U S West is the market leader, primarily a result of its commanding lead in the local frame relay market.

Frame Relay

The market for frame relay services will nearly double between 1996 and 1997 and will expand at a 1996–2001 CAGR of 46%. The following factors will affect the growth of frame relay services:

- Initially, frame relay met the largely unfulfilled market demand for an efficient LAN-to-LAN interconnection service. This market is reaching saturation, but increasing customer requirements (in terms of both bandwidth and interconnection of additional sites) will continue to drive demand.
- During the forecast period, LAN-to-SNA applications will be the major market driver for frame relay services as corporations seek to integrate SNA traffic from their legacy systems with LAN-based traffic. Carriers are encouraging this trend by offering a wider variety of managed frame relay assembler/disassembler (FRAD) solutions and through the introduction of permanent virtual circuit (PVC) prioritization.
